---

ZIM's ECO Data calculator, available free on ZIM's website, provides customers and partners with estimated carbon dioxide and sulfur oxide gas emissions from ZIM vessels.

The ECO Data Calculator enables data retrieval for specific lines and services, or between two locations, for any specific number of cargo volume or weight carried. The application allows users to initiate an emission report which can be saved, printed, or sent by email in a PDF format.

The emission data is based on the Clean Cargo Working Group latest emission factors methods and calculation, adjusted specifically for ZIM operated vessels.

"The ECO Data Calculator is part of ZIM's comprehensive and transparent approach to reducing emissions," said Dudi Avni, ZIM's vice president for customer service. "The ECO Data Calculator provides our customers with a reliable and accessible tool."

Environmental awareness, sustainability, and compliance with the most strict industry standards are part of ZIM's vision and values. ZIM-operated vessels adhere to the most strict industry standards regarding the environment. ZIM complies with all major international regulations concerning safety and the environment, such as ISO Environment Management System, SOLAS, ISM Code, MARPOL, IMDG, and more.
